AquaCare Sea Salt is available in:
4 kg bags 10 kg bags 20 kg buckets
25 kg bags big packs with 500 kg (mixed or unmixed)

Instant Sea Salt

The AquaCare Sea Salt contains all macro elements (like sodium, chloride, etc.) in the same concentration as in natural sea water. Trace elements are composed with more than 30 years experience. AquaCare has chosen a composition that realizes the consumption of the animals, the accumulation of some substances and the losses with precipitation and co skimming. Long experiences in keeping and breeding of many animals underlines the high quality of AquaCare Sea Salt.

For tropic systems the readily mixed sea salt is only to be mixed into the water (reverse osmosis water) and the sea water is ready for use after a short time. The advantages of AquaCare sea salt are: high concentration of soluble calcium, high solubility in warm water and highly purified ingredients (conform to the purity standards of the German and European Pharmacopoeia DAB and Ph. Eur).

2-Components Sea Salt

For temperate and arctic systems AquaCare offers a 2 components sea salt. The main component dissolves within seconds in water. After this the calcium component is to be added in that quantity the user what to have. The maximum calcium concentration depends on several factors:

Is Calcium needed by the animals? (crustaceans do not like high concentrations of calcium; on the other hand SPS hard corals need high amounts of soluble calcium)

Is a chalk reactor or another source for calcium installed)?

How high is the solubility of calcium in the specific tank at that specific temperature and pH value?

Additives

If you need special components for your aqua culture, AquaCare offers specific substances like iodine, strontium, magnesium, minerals or high density protection polymers. The AquaCare team tries to evaluate the substances, offers economical solutions to optimise your aqua culture systems.

Please do not hesitate to contact our team.
